

FORAGE SUITABILITY GROUP OVERFLOW

FSG No.: G063AY500SD

Major Land Resource Area: 63A - Northern Rolling Pierre Shale Plains

Physiographic Features

The soils in this group are mostly found on flood plains and low terraces.

	<u>Minimum</u>	<u>Maximum</u>
Elevation (feet):	1300	2950
Slope (percent):	0	3
Flooding:		
Frequency:	None	Frequent
Duration:	None	Brief
Ponding:		
Depth (inches):		
Frequency:	None	None
Duration:	None	None
Runoff Class:	Low	High

Climatic Features

This group occurs in a mid-continental climate characterized by wide seasonal temperature and precipitation fluctuations and extremes.

Annual precipitation varies widely from year to year in MLRA 63A. Average annual precipitation for all climate stations listed below is about 17 inches. About 77 percent of that occurs during the months of April through September. On average, there are about 25 days with greater than .1 inches of precipitation during that same time period. Precipitation is less than needed for optimum forage production and is the single largest factor limiting production from this group on non-irrigated lands.

Average annual snowfall ranges from 24 inches at Midland to 48 inches at Milesville. Snow cover at depths greater than 1 inch range from 27 days at Midland to 82 days at Timber Lake.

Average July temperatures across the MLRA are about 75°F and average January temperatures are about 17°F. Recorded temperature extremes in the MLRA during the years 1961 to 1990 are a low of -37 at Kennebec and a high of 114 at both Kennebec and Midland. The MLRA lies in USDA Plant Hardiness Zones 4a, 4b and 5a.

The climate data listed in the tables below represent high and low ranges and averages for the climate stations and dates listed. For additional climate data, access the National Water and Climate Center at <http://www.wcc.nrcs.usda.gov>.

Soil Interpretations

This group consists of very deep, moderately well and well drained, medium to fine textured soils formed from alluvium. Permeability is slow to moderate, and available water capacity is high.

Drainage Class:	Well drained	To	Well drained
Permeability Class:	Slow	To	Moderate
(0 - 40 inches)			
Frost Action Class:	Low	To	High

	<u>Minimum</u>	<u>Maximum</u>
Depth:	72	
Surface Fragments >3" (% Cover):	0	3
Organic Matter (percent):	1.0	5.0
(surface layer)		
Electrical Conductivity (mmhos/cm):	0	4
(0 - 24 inches)		
Sodium Absorption Ratio:	0	10
(0 - 12 inches)		
Soil Reaction (1:1) Water (pH):	6.1	8.4
(0 - 12 inches)		
Available Water Capacity (inches):	9	12
(0 - 60 inches)		
Calcium Carbonate Equivalent	0	13
(0 - 12 inches)		

Adapted Species List

The following forage species are considered adapted to grow on the soils in this group. Additional information concerning plant characteristics of a number of the listed species as well as individual cultivars of many of those species can be accessed at <http://plants.usda.gov/>.

Overflow

Pastureland and Hayland Interpretations

Cool Season Grasses

Altai wildrye	G
Canada wildrye	G
Creeping foxtail	F
Crested wheatgrass	G
Green needlegrass	G
Intermediate wheatgrass	G
Meadow brome	G
Newhy hybrid wheatgrass	G
Pubescent wheatgrass	G
Reed canarygrass	F
Russian wildrye	G
Slender wheatgrass	G
Smooth brome	G
Tall wheatgrass	G
Western wheatgrass	G

Warm Season Grasses

Big bluestem	G
Indiangrass	G
Little bluestem	G
Sand bluestem	F
Sideoats grama	G
Switchgrass	G

Legumes

Alfalfa	G
Birdsfoot trefoil	F
Canada milkvetch	G
Cicer milkvetch	G
Purple prairieclover	F
Sainfoin	F
Sweetclover	G
White prairieclover	F

G - Good adaptation for forage production on this group of soils in this MLRA

F - Fair adaptation but will not produce at its highest potential

Production Estimates

Production estimates listed here should only be used for making general management recommendations. Onsite production information should always be used for making detailed planning and management recommendations.

The high forage production estimates listed below are based on dense, vigorous stands of climatically adapted, superior performing cultivars. They are properly fertilized for high yields and pest infestations are kept below economic thresholds. Mechanical harvests are managed to maintain stand life by cutting at appropriate stages of maturity and harvest intervals. If grazed, optimum beginning and ending grazing heights are adhered to. Adequate time is allowed for plant recovery before entering winter dormancy under both uses.

The production estimates listed below represent total annual above ground plant production on an air-dry-matter basis. Estimates of hay and grazing yields can be calculated from these numbers by multiplying them by a harvest efficiency. A 70 percent harvest efficiency is commonly used when converting to hay yields. Pasture harvest efficiency is highly dependent on the grazing management system applied, ranging from 25 to 50 percent.

Forage Crop**Management Intensity**

	<u>High</u> (lbs/ac)	<u>Low</u> (lbs/ac)
Alfalfa	9100	3700
Alfalfa/Intermediate	7200	2900
Alfalfa/Smooth brome	7200	2900
Big bluestem	6500	2800
Indiangrass	4600	2500
Intermediate wheatgrass	5600	2600
Smooth brome	5600	2600
Switchgrass	7200	3200

Forage Growth Curves

Growth curves estimate the seasonal distribution of growth of the various forage crops. They indicate when the forages may be available for grazing or mechanical harvest.

Soil Limitations

These soils have few limitations to the production of climatically adapted forage crops. Production potential is high. Flooding is a potential hazard to some of these soils. Also, all of these soils receive additional moisture, so the potential exists for soil compaction from grazing or operating machinery on them when wet.

Management Interpretations

Soils in this group that are subject to flooding can have forage production adversely impacted if it occurs during the spring or growing season. Flooding duration or the time period plants are under water is more important than flooding frequency for the survival of forage crops. If these soils flood it is generally for only a brief time. Exclude livestock and machinery during extended periods of soil wetness to reduce soil compaction. When establishing new stands or renovating stands select species and varieties that can make best use of the additional soil moisture this group receives.

FSG Documentation**Similar FSG's:****FSG ID FSG Narrative**

G063AY100SD Loamy soils do not receive the additional water and are less productive.

G063AY700SD Subirrigated soils have elevated water tables that come closer to the surface during part of the growing season.
